No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours in plants. The polynucleotide is useful for modifying e.g. leaf colour, flower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide derived from tomato, useful for producing an Anthocyanin 1 phenotype in plants, particularly for modifying e.g. leaf color, flower color or fruit color in plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 200

                                                                                                                                                                                                                                                                                                                          The present invention describes tomato anthocyanin 1 (ANT1). The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours, flower the polynucleotide is useful for modifying e.g. leaf colour, flower colour or fruit colour in plants. The present sequence represents an ANT1 genomic DNA fragment which is used in an example from the present ANT1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide derived from tomato, useful an Anthocyanin 1 phenotype in plants, particularly for leaf color, flower color or fruit color in plants -
                                                                                                                                                                                                                                                                                    Sequence

The present cDNA sequence is homologue G2421 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the to alter seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                                    Nucleic acids encoding plant transcription factor polypeptides, for altering the developmental and structural characteristics of plants, e.g. corn, potato and cotton plants -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문
                      encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a that its polynucleotide is used for producing a plant having a recombinant polynucleotide is used for producing a plant having a that

The present sequence is one of the 232 polynucleotides encoding an A. thaliana transcription factor.

                                                                                                                                                                                                                                                                                                                          The invention relates to an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions CC to a sequence selected from any one of 99 sequences (ABN98231-ABN99231), CC given in the specification or its fragment. A polypeptide (II) encoded by CC (I), a transgenic plant (III) comprising an exogenous nucleic acid or a CC genetically modified cell (IV) comprising an exogenous nucleic acid, is CC useful in identifying homologous or related genes, in producing CC compositions that modulate the expression or function of its encoded CC protein, mapping functional regions of the protein and in studying a ssociated physiological pathways. (I) is also useful for the genetic CC manipulation of cells, particularly plant cells. (I) is also useful in CC screening assays of various plant strains to determine the strains that CC are best capable of withstanding a particular disease or environmental CC strees. (II) and (III) are useful for screening of biologically active CC agents, e.g. fungicides, insecticides, etc., for elucidating biochemical CC pathways. The screened agents are useful in improved methods of treating CC programs to identify agents that mimic or enhance the action of tolerance CC factors. Such agents are useful in improved methods of treating crops to CC enhance their tolerance to environmental stress. (I) is also useful for identifying other mediators that may induce constrained to the production of a biosynthetic product in a CC particular plant, for identifying other mediators that may induce tolerance to environmental stress, for identifying factors involved in biosynthetic pathways of nutritional, commercial or medicinal value and constrained or medicinal value.
                                                                            Matches

                                                                                                                                                                                       for identifying productions of nutritional, commercial or medicinal value. (IV) is useful in the study of genetic function and regulation, for alteration of the cellular metabolism and for screening compounds that may affect the biological function of the gene or gene products. Note: The sequence data for this patent did not form part of the print specification, but was obtained in electronic format directly from USP at segdata.uspto.gov/sequence.html?DocID=999909770445.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New Arabidopsis thaliana nucleic acid for identifying homologous genes, producing compositions that modulate the expression or function of its

They may also be used to alter seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is Arabidopsis thaliana transcription factor G663 CDNA. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify phrenyl lipid content, to modify fatty acid and modify seeds, to modify phrenyl lipid content, to modify fatty acid and modify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             문
          This invention relates to the nucleotide and protein sequences of novel Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosome 1. PAP1 and PAP2 have been mapped to chromosome 1. PAP1 and PAP2 are MYB-like transcription factors that regulate the production of anthocyanin pigment. The nucleotide sequence of the invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for plant cell (e.g., A. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour
                                                                                                                                                                            Claim
                                                                                                                                                                                                 New isolated PAP1 or PAP2 gene, useful for increasing pigmentation in plants, as reporter genes for analysing expression pattern of promotes of interest, and to increase flux through phenylpropanoid pathway
                                                                                                                                                                                                                                                                                                         Borevitz J,

A transgenic plant is useful for detecting a stress condition such as light stress, water stress, plastress, temperature stress, heavy metal stress, pathogen attack or infection, wounding, nutrient deficiency, herbivory, or abnormal hormone levels in a plant. PAPI or PAP2 overexpression can also be useful in developing or enhancing desirable colouration in ornamental plants for commercial sales, and for sensitising plants to stress. Introduction of PAP1 or PAP2 sensitises
                                                                                                                                                                                                                                                                                                                                                                                                                   alkaloid pathway gene; taxadiene synthase; biological pathway; freezing; abiotic stress; cold; drought; heat; nutrient deficiency; biotic stress; infection; developmental pathway; flowering; root development; TDS; LS; transgenic; transgenic plant; gene; ds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1033 BP; 334 A; 161 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plants to respond more quickly to a stress condition in ways that are physiologically significant, as well as in ways of ornamental significance. The present sequence represents the A. thaliana PAP2 cD
                                                                                                                       WO200274917-A2
                                                                                                                                                                                                                                                                                                                                                             Arabidopsis thaliana.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transcription factor; metabolite pathway; terpenoid; limonene synthase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC a polynucleotide which encodes a transcription factor for controlling the CC determining whether a member of a pool of test transcription factor or CC polynucleotides encodes a biosynthetic pathway transcription factor or CC polynucleotides encodes a biosynthetic pathway transcription factor or CC a primary metabolite pathway gene or a secondary metabolite pathway gene cranscription factor. It CC is also useful for determining whether a member of a pool of test encodes CC a Mentha sp. or Taxus sp. terpenoid pathway gene where the terpenoid CC pathway gene encodes limonene synthase (IS) or taxadiene synthase (TDS). CC It is also useful for identifying one or more transcription factors that CC activate one or more genes of a biological pathway of a plant, fungi or CC animal cell, where the biological pathway can be a biochemical pathway CC such as biosynthetic pathways for soluble and insoluble carbohydrates, CC for amino acids and a response pathway to abiotic stress such as cold, CC as fungl, viral or bacterial infection, developmental pathway such as Cl flowering, root development. A response pathway for soluble and stress such as CC flowering, root development.
                                                                                                                                                          밁

The specification describes AtMYB60, AtMYB764, AtMYB75 and AtMYB90. MYB polypeptides are useful for enhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity. MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, flavonoids, lignins, salicylic acid, anthocyanins, and phenolic

The present cDNA sequence is homologue G2422 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the present of seeds as shalf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination
                                                                                                                                                                                Nucleic acids encoding plant transcription factor polypeptides, to for altering the developmental and structural characteristics of plants, e.g. corn, potato and cotton plants -

They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                                                                  22-AUG-2000; 2000US-227439P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant, or the plant exhibits an altered CC phenotype as compared to a wild-type or reference plant, or the plant CC exhibits ectopic expression or altered expression of one or more genes CC associated with a plant trait as compared to a wild plant. Also included associated with a plant trait as compared to a wild plant. Also included CC are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a CC homologue sequence from a database comprising a plurality of known plant CC sequences comprising sequence information selected from one of CC 464 fully defined sequences given in the specification. The isolated or CC encodes a polynucleotide is used for producing a plant having a CC encodes a polynucleotide or an antisense nucleic acid, inserting the CC polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress CC plant, and selecting for a modified trait (e.g. increased chemicals, post tolerance, herbride resistance, seed and fruit yield, growth CC pest tolerance, herbride resistance, seed and fruit yield, growth CC trate, leaf and flower sensescence and many other traits listed in the CC encoding an A. thaliana transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                             CC Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 CC Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 CC Arabidopsis thaliana production of anthocyanin pigment paye been mapped to chromosome C1. PAP1 and PAP2 are MYB-like transcription factors that regulate the CC invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The CC useful for detecting promoter activity within a plant cell sequence is also useful for screening for plant cell (e.g., CA, thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour cexpression. The nucleotide sequence is also useful for enhancing CC expression of phenylpropanoid product in a plant. A transgenic CC plant is useful for detecting a stress condition such as light CC stress, water stress, pH stress, temperature stress, heavy metal constress, water stress, pH stress, temperature stress, heavy metal constress, water stress, pH stress, temperature stress, heavy metal constress, pathogen attack or infection, wounding, nutrient deficiency, CC herbivory, or abnormal hormone levels in a plant. PAP1 or PAP2 constitution in ornamental plants for commercial sales, and for colouration in ornamental plants for commercial sales, and for colouration of plants to respond more quickly to a stress condition in ways that are physiologically significant, as well as in ways of ornamental CC sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PAP1; production of anthocyanin pigment; MYB-like transcription factor; transgenic; plant; phenylpropanold; stress; light stress; water stress; bH stress; temperature stress; heavy metal stress; pathogen attack; infection; wounding; nutrient deficiency; herbivory; plant colouration;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated PAP1 or PAP2 gene, useful for increasing pigmentation in plants, as reporter genes for analysing expression pattern of promoter of interest, and to increase flux through phenylpropanoid pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABK14221 standard; cDNA; 956 BP

The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       associated with a plant trait as compared to a wild plant. Also included CC are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a composition of the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant; and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
